

4-Channel LED Backlight Controller

Features

- **4 Channels**
- **5.5V to 30V Input Voltage Supply**
- **Drive up to 68 (17x4) White LEDs (3.5V/160mA Each)**
- **Current Match (Balance) $\pm 1\%$ (Typ.)**
- **Current Accuracy $\pm 1\%$ (Typ.)**
- **External PWM Input from 100Hz to 50kHz Dimming Frequency**
- **Time Shift PWM Dimming Control**
- **Random Channel Selection for Dynamic Operations**
- **Adjustable Switching Frequency**
- **Protections**
 - String Open Circuit Detection
 - String Short Circuit Detection
 - Over-Temperature Protection
 - Over-Voltage Protection
- **Available in TSSOP-16P, SOP-16, DIP-16 and QFN4x4-16A Packages**
- **Lead Free and Green Devices Available (RoHS Compliant)**

Applications

- **NB LED Backlight**
- **LCD Monitor Backlight**
- **LCD TV LED Backlight**

General Description

The APW7228B is a high efficiency driver for 4 channels of LEDs. It contains an adjustable-frequency current-mode PWM step-up controller, a 5V linear regulator, dimming control circuit and eight regulated current source circuit.

The APW7228B is capable of driving typically 68 (4x17) pieces of 3.5V/160mA LEDs. It contains 4 channels of voltage controlled current sources with typical currents matching of $\pm 1\%$, which compensate for the non-uniformity effect of forward voltages variance in the LED stacks. To minimize the voltage headroom and power loss in the typical multi-strings operation, the APW7228B features a dynamic headroom control that monitors the highest LED forward voltage string and uses its feedback signal for output regulation.

The APW7228B features extensive protection functions that include LED strings open and short circuit detections, Output Over-Voltage Protection (OVP) and Over-Temperature Protection (OTP).

The APW7228B is available in TSSOP-16P, SOP-16, DIP-16 and QFN4x4-16A package.

Simplified Application Circuit

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Pin Configuration

Pin Configuration(Cont.)

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{IN}	VIN Input Voltage (VIN to GND)	-0.3 to 40	V
V_{ISW}	ISW to GND Voltage	-0.3 to 65	V
$V_{ISEN1} - V_{ISEN4}$	ISEN1 – ISEN4 to GND Voltage	-0.3 to 65	V
$I_{ISEN1-4}$	ISEN1 – ISEN4 LED Current	~ 180	mA
V_{IO}	VREF, OVP, ENA, PWM, STATUS to GND Voltage	-0.3 to 7	V
	RT, ISET, SSTCMP, LDR to GND Voltage	-0.3 to VREF+0.3	V
T_J	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature	-65 to 150	°C
T_{SDR}	Maximum Lead Soldering Temperature (10 Seconds)	260	°C

Note1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

Thermal Characteristics

Typical Application Circuit

(Using TSSOP-16P)

Block Diagram

Function Description

The APW7228B is a high efficiency driver for 4 channels of LEDs. It contains an adjustable-frequency current-mode PWM step-up controller, a 5V linear regulator, dimming control circuit and eight regulated current source. The APW7228B contains 4 channels of voltage controlled current sources with typical currents matching of $\pm 1\%$, which compensate for the non-uniformity effect of forward voltages variance in the LED stacks. To minimize the voltage headroom and power loss in the typical multi-strings operation, the APW7228B features a dynamic headroom control that monitors the highest LED forward voltage string and uses its feedback signal for output regulation.

Enable and PWM

Driving ENA to the ground places the APW7228B in shutdown mode. When in shutdown, the internal gate driver turns off. The PWM can be used for PWM input for dimming. If the dimming function is not used, connect PWM and EN together. The EN and PWMI pins cannot be floating, thus a pull-low resistance may needs to be added.

Current Source

The APW7228B integrated 4 matched current sources to maintain uniform LED brightness for LCD backlight application. The maximum LED current is set by R_{ISET} pin with a scaling factor $1200/R_{ISET}$. The minimum voltage drop across each current source is 0.35V when the LED is 20mA. The low drop-voltage reduces power loss to improve efficiency.

The APW7228B detect the voltage from any of ISEN pins. When the lowest current source voltage is lower than the short circuit threshold, V_{SC} , such will be use as the feedback signal of the error amplifier input. The converter boosts the output voltage to the corresponding level using the lowest current source voltage. Since all LED strings connect to the same output voltage, the other pins will have a higher voltage, but the current sources could regulate the same current on all channel within 1%. The lowest current source voltage is related to R_{ISET} resistance setting. When the R_{ISET} is bigger, the lowest current source voltage level is lower.

Programming the BOOST switching Frequency

The resistor R_{RT} that is connected from the RT pin to the GNDA pin programs the boost converter switching frequency F_{SW} . The approximate PWM switching frequency is written as:

$$F_{SW} = \frac{1}{K \cdot R_{RT}}$$

Where:

- F_{SW} is the PWM switching frequency
- R_{RT} is the F_{SW} programming resistor
- $K = 2 \times 10^{-11}$

PWM Dimming Controls

The APW7228B uses PWM signal to control LED current, and therefore brightness.

- Maximum LED Current Setting

Placing a resistor from ISET pin to GND sets the maximum LED current.

$$I_{LEDMAX} = 1200/R_{RSET}$$

- PWM Signal Input

The brightness could be adjusted by a PWM signal from PWM pin. The average LED current is proportion to duty cycle of PWM signal.

$$I_{LEDAVG} = I_{LEDMAX} \times D_{PWM}$$

where D_{PWM} = duty cycle of PWM input signal. The PWM signal operation suggestion can follow the formula as below,

Minimum PWM Signal On Time:

$$\text{Duty} (\%) \geq 1500 \times 10^{-6} \times F_{PWM_Signal} (\text{Hz})$$

Minimum PWM Signal Off Time:

$$(1 - \text{Duty}) (\%) \geq 50 \times 10^{-6} \times F_{PWM_Signal} (\text{Hz})$$

Thus, the PWM dimming frequency could up to 40kHz with duty cycle range from 60% to 98%. If the dimming frequency is below 200Hz, the duty cycle range can be 0.3% to 99.99%.

Function Description (Cont.)

PWM Dimming Controls (Cont.)

- Phase Shift

APW7228B provides a phase-shifted feature to reduce audible noise and ripple stresses. Referring to Figure 1, every two ISEN rising and falling edges are phase-shifted $2\mu\text{s}$. ISEN1 follow external PWM signal and its delay time is about $1\mu\text{s}$.

Figure 1. Phase-Shifted

5V Low Dropout Regulator

A 5V linear regulator is integrated to supply internal circuit and driver. Because VREF is the LDO output pin, it requires a bypass capacitor of $1\mu\text{F}$ or more for the regulation. The VREF pin can be used as a coarse reference with 25mA sourcing capability.

Inrush Current Control and Soft-Start

The APW7228B integrates independent inrush current control and soft-start functions. When the rising VREF voltage reaches the rising POR voltage threshold, the POR signal goes high and the chip initiates soft-start operations.

During the soft-start, the step-up regulator directly limits the peak inductor current. The current-limit level is increased through the soft-start period from zero up to the full current-limit value in eight equal current steps ($I_{\text{LIM}}/8$).

- Short-Circuit Protection (SCP)

The APW7228B integrates the LED strings short-circuit protection (SCP) circuit. Such circuit monitors the voltage on each channel. When any channels exceed short-circuit threshold (8.5V typical), the device disable current channels. All the other good channels work normally.

- Open Circuit Protection (OCP)

The output voltage of APW7228B is regulated according to the minimum current source voltage on all strings in use. If one or more strings are opened, the respective ISEN are pulled to the GND. If any ISEN is below target current, the corresponding current source is disabled. The unaffected LED strings still operate normally. If all strings are opened, the APW7228B boosts the output voltage of converter high to the OVP threshold.

- Over-Voltage Protection (OVP)

When the load is opened, the converter unceasingly boosts the output voltage high. Therefore, an over-voltage protection, monitoring the output voltage via feedback input pin (OVP), is integrated into the chip to prevent the output voltage from exceeding their maximum voltage ratings. When the voltage on the OVP pin exceeds 2V , the converter stops switching and prevents the output voltage from rising. The converter can work again when the falling OVP voltage falls below the OVP voltage threshold. The desired OVP threshold on output voltage can be set as below:

$$\text{OVP} = 2\text{V} \times (1 + R_{\text{UPPER}}/R_{\text{LOWER}})$$

- Over-Temperature Protection (OTP)

The over-temperature circuit limits the junction temperature of the APW7228B. When the junction temperature exceeds 150°C , a thermal sensor turns off the power MOSFET, allowing the devices to cool. The thermal sensor allows the converters to start a soft-start process and to regulate the output voltage again after the junction temperature cools by 30°C . The OTP is designed with a 30°C hysteresis to lower the average Junction Temperature (T_j) during continuous thermal overload conditions, increasing the lifetime of the device.

Function Description (Cont.)

Inrush Current Control and Soft-Start (Cont.)

- Output Short-Circuit Protection

Connecting a fuse component between the VIN and inductor terminals prevents the huge current by the output short to ground. Besides, the APW7228B monitors the voltage on OVP pin to sense output short to ground condition. During start-up, the current injects into output capacitor and then pull V_{OUT} voltage high. If the output is shortened to the ground, and then the OVP pin voltage does not exceed 0.1V after soft-start is completed, the low-side MOSFET is switched off.

Under-Voltage Lockout

The Under-Voltage Lockout (UVLO) circuit compares the input voltage at VREF with the UVLO threshold (4.2V, typical) to ensure the input voltage is high enough for reliable operation. The 0.2V (typical) hysteresis prevents supply transients from causing a restart. Once the VREF voltage exceeds the UVLO rising threshold, start-up begins. When the VREF voltage falls below the UVLO falling threshold, the controller turns off the converter.

Application Information

Input Capacitor Selection

The input capacitor (C_{IN}) reduces the current peaks drawn from the input supply and reduces noise injection into the IC. The reflected ripple voltage will be smaller with larger CIN. For reliable operation, it is recommended to select the capacitor voltage rating at least 1.2 times higher than the maximum input voltage. The capacitors should be placed close to the VIN and GND.

Inductor Selection

For high efficiencies, the inductor should have a low dc resistance to minimize conduction losses. Especially at high-switching frequencies the core material has a higher impact on efficiency. When using small chip inductors, the efficiency is reduced mainly due to higher inductor core losses. This needs to be considered when selecting the appropriate inductor. The inductor value determines the inductor ripple current. The larger the inductor value, the smaller the inductor ripple current and the lower the conduction losses of the converter. Conversely, larger inductor values cause a slower load transient response. A reasonable starting point for setting ripple current, ΔI_L , is 30% to 50% of the average inductor current. The recommended inductor value can be calculated as below:

$$L \geq \left(\frac{V_{IN}}{V_{OUT}} \right)^2 \times \frac{V_{OUT} - V_{IN}}{F_{SW} \times I_{OUT(MAX)}} \times \frac{\eta}{\left(\frac{\Delta I_L}{I_{L(AVG)}} \right)}$$

where

V_{IN} = input voltage

V_{OUT} = output voltage

F_{SW} = switching frequency in MHz

I_{OUT} = maximum output current in amp.

η = Efficiency

$\Delta I_L / I_{L(AVG)}$ = inductor ripple current/average current
(0.3 to 0.5 typical)

To avoid saturation of the inductor, the inductor should be rated at least for the maximum input current of the converter plus the inductor ripple current. The maximum input current is calculated as below:

$$I_{IN(MAX)} = \frac{I_{OUT(MAX)} \times V_{OUT}}{V_{IN} \times \eta}$$

The peak inductor current is calculated as the following equation:

$$I_{PEAK} = I_{IN(MAX)} + \frac{1}{2} \cdot \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{V_{OUT} \cdot L \cdot F_{SW}}$$

Output Capacitor Selection

The current-mode control scheme of the APW7228B allows the use of tiny ceramic capacitors. The higher capacitor value provides the good load transients response. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. If required, tantalum capacitors may be used as well. The output ripple is the sum of the voltages across the ESR and the ideal output capacitor.

$$\Delta V_{OUT} = \Delta V_{ESR} + \Delta V_{COUT}$$

$$\Delta V_{COUT} \approx \frac{I_{OUT}}{C_{OUT}} \times \left(\frac{V_{OUT} - V_{IN}}{V_{OUT} \times F_{SW}} \right)$$

$$\Delta V_{ESR} \approx I_{PEAK} \times R_{ESR}$$

where I_{PEAK} is the peak inductor current.

Application Information (Cont.)

Output Capacitor Selection (Cont.)

For ceramic capacitor application, the output voltage ripple is dominated by the ΔV_{COUT} . When choosing the input and output ceramic capacitors, the X5R or X7R with their good temperature and voltage characteristics are recommended.

Diode Selection

To achieve high efficiency, a Schottky diode must be used. The current rating of the diode must meet the peak current rating of the converter.

Recommended Capacitor Selection

Designator	Manufacturer	Part Number	Capacitance (μF)	TC Code	Rated Voltage (V)	Case size
C1	Murata	GRM31CR71H225KA88K	2.2	X7R	50	1206 T=1.6mm
C2	Murata	GRM32ER72A225KA35K	2.2	X7R	100	1206 T=1.6mm
C3	Murata	GRM32ER72A225KA35K	2.2	X7R	100	1206 T=1.6mm

Recommended Diode Selection

Designator	Manufacturer	Part Number	Maximum average forward rectified current (A)	Maximum repetitive peak reverse voltage (V)	Case size
D1	Zowie	SSCD210SH	2	100	1206-S T=3.4mm

Recommended MOSFET Selection

Designator	Manufacturer	Part Number	Drain-Source Breakdown Voltage (V)	Case size
Q1	ANPEC	APM1101	100	To-252-3

Layout Considerations

For all switching power supplies, the layout is an important step in the design; especially at high peak currents and switching frequencies. If the layout is not carefully done, the regulator might show noise problems and duty cycle jitter.

1. The input capacitor should be placed close to the VIN and GND. Connecting the capacitor with VIN and GND pins by short and wide tracks for filtering and minimizing the input voltage ripple.
2. Place compensation network components closed to SSTCMP pin.
3. Frequency setting Resistor R_{RT} , ILED string current setting resistor R_{ISET} and current sensing resistor R_{ISW} should close to the RT, ISET and ISW pins respectively.
4. A star ground connection or ground plane minimizes ground shifts and noise is recommended.
5. Since the VREF voltage is generated for internally supply rail. A 2.2 μF or greater ceramic capacitor must be connected as closed as possible to VREF pin for good filtering.

Classification Profile

Classification Reflow Profiles

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly
Preheat & Soak		
Temperature min (T_{smin})	100 °C	150 °C
Temperature max (T_{smax})	150 °C	200 °C
Time (T_{smin} to T_{smax}) (t_s)	60-120 seconds	60-120 seconds
Average ramp-up rate (T_{smax} to T_p)	3 °C/second max.	3°C/second max.
Liquidous temperature (T_L)	183 °C	217 °C
Time at liquidous (t_L)	60-150 seconds	60-150 seconds
Peak package body Temperature (T_p)*	See Classification Temp in table 1	See Classification Temp in table 2
Time (t_p)** within 5°C of the specified classification temperature (T_c)	20** seconds	30** seconds
Average ramp-down rate (T_p to T_{smax})	6 °C/second max.	6 °C/second max.
Time 25°C to peak temperature	6 minutes max.	8 minutes max.
* Tolerance for peak profile Temperature (T_p) is defined as a supplier minimum and a user maximum.		
** Tolerance for time at peak profile temperature (t_p) is defined as a supplier minimum and a user maximum.		

Classification Reflow Profiles (Cont.)

Table 1. SnPb Eutectic Process – Classification Temperatures (T_c)

Package Thickness	Volume mm ³ <350	Volume mm ³ ≥350
<2.5 mm	235 °C	220 °C
≥2.5 mm	220 °C	220 °C

Table 2. Pb-free Process – Classification Temperatures (T_c)

Package Thickness	Volume mm ³ <350	Volume mm ³ 350-2000	Volume mm ³ >2000
<1.6 mm	260 °C	260 °C	260 °C
1.6 mm – 2.5 mm	260 °C	250 °C	245 °C
≥2.5 mm	250 °C	245 °C	245 °C

Reliability Test Program

Test item	Method	Description
SOLDERABILITY	JESD-22, B102	5 Sec, 245°C
HOLT	JESD-22, A108	1000 Hrs, Bias @ $T_j=125^{\circ}\text{C}$
PCT	JESD-22, A102	168 Hrs, 100%RH, 2atm, 121°C
TCT	JESD-22, A104	500 Cycles, -65°C~150°C
HBM	MIL-STD-883-3015.7	VHBM 2KV
MM	JESD-22, A115	VMM 200V
Latch-Up	JESD 78	10ms, I_{tr} 100mA

Customer Service

Anpec Electronics Corp.

Head Office :

No.6, Dusing 1st Road, SBIP,

Hsin-Chu, Taiwan, R.O.C.

Tel : 886-3-5642000

Fax : 886-3-5642050

Taipei Branch :

2F, No. 11, Lane 218, Sec 2 Jhongsing Rd.,

Sindian City, Taipei County 23146, Taiwan

Tel : 886-2-2910-3838
