Ultra-Low On-Resistance, 6A Dual Load Switch with Soft Start

Features

- **20mΩ(Typical) On-resistance per Channel**
- **6A Continuous Current**
- **Soft Start Time Programmable by External Capacitor**
- **Wide Input Voltage Range (VIN): 0.8V to 5.5V**
- **Supply Voltage Range (VBIAS): 3V to 5.5V**
- **Output Discharge when Switch Disabled**
- **Reverse Current Blocking when Switch Disabled**
- **Over-Temperature Protection**
- **Enable Input**
- **Lead Free and Green Devices Available (RoHS Compliant)**

General Description

The APL3528 is an ultra-low on-resistance, dual power-distribution switch with external soft start control. It integrates two N-channel MOSFETs that can deliver 6A continuous load current each.

The device integrates over-temperature protection. The over temperature protection function shuts down the N-channel MOSFET power switch when the junction temperature rises beyond 160°C and will automatically turns on the power switch when the temperature drops by 40°C. The device is available in lead free TDFN2x3-14A packages.

Applications

- **Notebook**
- **AIO PC**

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines “Green” to mean lead-free (RoHS compliant)and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{BIAS}	BAIS to GND Voltage	-0.3 ~ 6	V
V_{IN1}, V_{IN2}	VIN1, VIN2 to GND Voltage	-0.3 ~ 6	V
V_{OUT1}, V_{OUT2}	VOUT1, VOUT2 to GND Voltage	-0.3 ~ 6	V
V_{EN1}, V_{EN2}	EN1, EN2 to GND Voltage	-0.3 ~ 6	V
T_J	Maximum Junction Temperature	-40 ~ 150	°C
T_{STG}	Storage Temperature	-65 ~ 150	°C
T_{SDR}	Maximum Lead Soldering Temperature (10 Seconds)	260	°C

Note 1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ_{JA}	Junction-to-Ambient Resistance in Free Air (Note 2)	80	°C/W

Note 2: θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions (Note 3)

Symbol	Parameter	Range	Unit
V_{BIAS}	VBIAS Input Voltage ($V_{BIAS} \geq V_{IN}$)	3.0 ~ 5.5	V
V_{IN}	VIN Input Voltage	0.8 ~ 5.5	V
I_{OUT}	VOUT Output Current (Single Channel)	0 ~ 6	A
	Maximum Pulsed Switch Current, Pulse<300µs, 1% Duty Cycle (Single Channel)	8	
P_D	Maximum Power Dissipation, T_A=50°C (Note4)	0.94	W
V_{IH}	EN/ENB Logic High Input Voltage	1.2 ~ 5.5	V
V_{IL}	EN/ENB Logic Low Input Voltage	0 ~ 0.4	V
T_A	Ambient Temperature	-40 ~ 85	°C
T_J	Junction Temperature	-40 ~ 125	°C

Note 3 : Refer to the typical application circuit.

Note 4 : Refer to the thermal consideration on page 14.

Electrical Characteristics

Unless otherwise specified, these specifications apply over V_{IN1}= V_{IN2}= 0.8V~5.5V, V_{EN1}= V_{EN2}=V_{BIAS} =5V and T_A= -40~85°C. Typical values are at T_A=25°C.

Note: The table Contains soft-start time values measured on a typical device. The soft-start times shown are only valid for the power-up sequence where V_{IN} and V_{BIAS} are already in steady state condition, and EN pin is asserted high.

Function Description

VIN Under-voltage Lockout (UVLO)

A under-voltage lockout (UVLO) circuit monitors the VBIAS pins voltage to prevent wrong logic controls. The UVLO function initiates a soft-start process after the BIAS supply voltages exceed rising UVLO voltage threshold during powering on.

Power Switch

The power switch is an N-channel MOSFET with a ultra-low $R_{DS(ON)}$. When IC is in shutdown state ($V_{EN1,2}$=0V), the MOSFET prevents a reverse current flowing from the VOUT back to VIN. When IC is in UVLO state, the internal parasitic diodes connected from VOUT to VIN will be forward biased.

Soft-start

The APL3528 Provides an adjustable soft-start circuitry to control rise rate of the output voltage and limit the current surge during start-up. The soft-start time is set with a capacitor from the SS pin to the ground.

Enable Control

The APL3528 has a dedicated enable pin (EN). A logic low signal applied to this pin shuts down the output. Following a shutdown, a logic high signal re-enables the output through initiation of a new soft-start cycle.

Over-Temperature Protection (OTP)

When the junction temperature exceeds 150°C, the internal thermal sense circuit turns off the power FET and allows the device to cool down. When the device's junction temperature cools by 30°C, the internal thermal sense circuit will enable the device, resulting in a pulsed output during continuous thermal protection. Thermal protection is designed to protect the IC in the event of over temperature conditions. For normal operation, the junction temperature cannot exceed T_J=+125°C.

Application Information

Power Sequencing

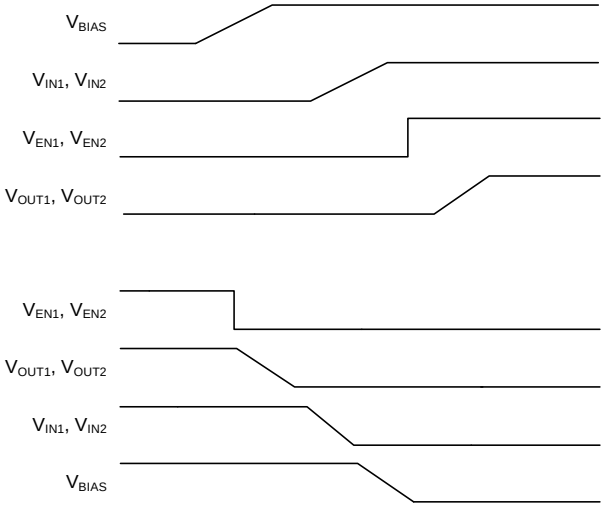

Figure 2. APL3528 Power Sequencing Diagram

The APL3528 has a built-in reverse current blocking circuit to prevent a reverse current flowing through the body diode of power switch from the VOUT back VIN pin when power switch disabled. The reverse current blocking circuit is not active before V_{BIAS} is ready. When IC is in UVLO state, the internal parasitic diodes of power switch connected from VOUT to VIN will be forward biased. Otherwise, VOUT should not be higher than VBIAS, and VBIAS must be higher than the voltage of any other input pin, the reason is that the internal parasitic diodes connected from VOUT to VBIAS will be forward biased.

Capacitor Selection

The APL3528 requires proper input capacitors to supply current surge during stepping load transients to prevent the input voltage rail from dropping. Because the parasitic inductor from the voltage sources or other bulk capacitors to the VIN pin limit the slew rate of the surge currents, more parasitic inductance needs more input capacitance.

For normal applications (except OTP or output short circuit has occurred), the recommended input capacitance of VIN is 1µF. Additional input capacitance may be needed on the input to reduce voltage overshoot from exceeding the absolute maximum voltage of the device during load transient conditions. The output capacitance of VOUT is 0.1µF at least. Please place the capacitors near the APL3528 as close as possible.

A bulk output capacitor, placed close to the load, is recommended to support load transient current.

Soft-Start Capacitor

The soft-start capacitor on SS pin can reduce the inrush current and overshoot of output voltage. The soft-start time is set with a capacitor from the SS pin to the ground.

Thermal Consideration

The APL3528 maximum power dissipation depends on the differences of the thermal resistance and temperature between junction and ambient air. The power dissipation P_D across the device is:

$$P_D = (T_J - T_A) / \theta_{JA}$$

where (T_J-T_A) is the temperature difference between the junction and ambient air. θ_{JA} is the thermal resistance between junction and ambient air. Assuming the T_A=25°C and maximum T_J=150°C (typical thermal limit threshold), the maximum power dissipation is calculated as:

$$P_{D(max)}=(150-25)/80$$
$$= 1.56(W)$$

For normal operation, do not exceed the maximum operating junction temperature of T_J = 125°C. The calculated power dissipation should be less than:

$$P_D=(125-25)/80$$
$$=1.25(W).....T_A=25^oC$$
$$P_D=(125-85)/80$$
$$=0.5(W).....T_A=85^oC$$

The power dissipation depends on operating ambient temperature for fixed T_J=125°C and thermal resistance θ_{JA}. For APL3528 packages, the Figure 3~4 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.

$$P_D = (I_{OUT1}^2 + I_{OUT2}^2) \cdot R_{DS,ON}$$
$$R_{DS,ON} = 0.031\Omega \quad \textbf{L L L L L L L L } T_J = 125^\circ C$$
$$I_{OUT2} = k \cdot I_{OUT1} \quad \textbf{L L L L L L L L } k \le 1$$
or
$$I_{OUT1} = k \cdot I_{OUT2} \quad \textbf{L L L L L L L L } k \le 1$$
$$I_{OUT1,2(MAX)} = 6A$$

Layout Consideration

The PCB layout should be carefully performed to maximize thermal dissipation and to minimize voltage drop, droop and EMI. The following guidelines must be considered:

1. Please place the input capacitors near the VIN pin as close as possible.
2. Output decoupling capacitors for load must be placed near the load as close as possible for decoupling high frequency ripples.
3. Locate APL3528 and output capacitors near the load to reduce parasitic resistance and inductance for excellent load transient performance.
4. The negative pins of the input and output capacitors and the GND pin must be connected to the ground plane of the load.
5. Keep VIN and VOUT traces as wide and short as possible.
