

USB Power-Distribution Switches

Features

- **62mW Power Switch On Resistance**
- **Wide Supply Voltage Range: 2.7V to 5.5V**
- **Fix Current Limit Protection**
- **Fast Over current Response: 2us (typ.)**
- **Over-Temperature Protection**
- **Fault Indication Output**
- **Enable Input**
- **Built-in Soft-Start**
- **Reverse Input-Output Voltage Protection: 25mV (typ.)**
- **UL Approved-File No. E328191**
- **UL-CB Scheme IEC/EN62368-1 Certified**
- **TUV IEC/EN62368-1 Certified**

General Description

The APL3553E/F/G/H series of power switches are designed for USB applications. The 62mΩ N-channel MOSFET power switch satisfies the voltage drop requirements of USB specification.

The protection features include current-limit protection, short-circuit protection, and over-temperature protection. The device limits the output current at current limit threshold level. When V_{OUT} drops below $V_{IN}-1V$, the devices limit the current to a lower and safe level. The over-temperature protection limits the junction temperature below 140°C in case of short circuit or over load conditions. Other features include a deglitched OCB output to indicate the fault condition and an enable input to enable or disable the device.

Simplified Application Circuit

Applications

- **Notebook and Desktop Computers**
- **USB Ports**
- **High-Side Power Protection Switches**
- **MHL Ports**

Pin Configurations

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

APL3553 X: L553O XXX ● XX	X - Date Code O - EN Function Code

Note : ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{IN}	VIN Input Voltage (VIN to GND)	-0.3 ~ 7	V
V_{OUT}	VOU to GND Voltage	-0.3 ~ 7	V
V_{ENB}, V_{EN}	EN, ENB to GND Voltage	-0.3 ~ 7	V
V_{OCB}	OCB to GND Voltage	-0.3 ~ 7	V
T_J	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature	-65 ~ 150	°C
T_{SDR}	Maximum Lead Soldering Temperature, 10 Seconds	260	°C

Note1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ_{JA}	Junction-to-Ambient Resistance in Free Air ^(Note 2)	SOT-23-5	°C/W
		SOT-23-6	
		MSOP-8	
θ_{JC}	Junction-to-Case Resistance in Free Air ^(Note 2)	SOT-23-5	°C/W
		SOT-23-6	
		MSOP-8	

Note 2 : θ_{JA} and θ_{JC} is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions (Note 3)

Symbol	Parameter	Range	Unit
V_{IN}	VIN Input Voltage	2.7 ~ 5.5	V
I_{OUT}	OUT Output Current (APL3553E/F)	0 ~ 2	A
	OUT Output Current (APL3553G/H)	0 ~ 1	
T_A	Ambient Temperature	-40 ~ 85	°C
T_J	Junction Temperature	-40 ~ 125	°C

Note 3 : Refer to the typical application circuit

Electrical Characteristics

Unless otherwise specified, these specifications apply over $V_{IN}=5V$, $V_{EN}=5V$ or $V_{ENB}=0V$ and $T_A = -40 \sim 85^\circ C$. Typical values are at $T_A=25^\circ C$.

Pin Description

PIN				FUNCTION
SOT-23-5	SOT-23-6	MSOP-8	NAME	
2	2	1	GND	Ground.
5	3	2,3	VIN	Power Supply Input. Connect this pin to external DC supply.
4	1	4	EN	Enable Input. Pulling this pin to high will enable the device and pulling this pin to low will disable device. The EN pin cannot be left floating.
3	6	5	OCB	Fault Indication Pin. This pin goes low when a current limit or an over-temperature condition is detected after a 12ms deglitch time.
1	4,5	7,8	VOUT	Output Voltage Pin. The output voltage follows the input voltage.
-	-	6	NC	No connection.

Block Diagram

Timing diagram for the RCP release sequence. The diagram shows three signals: VIN-VOUT, IOUT, and OCB. VIN-VOUT starts at a high level, then drops to a level labeled $<-6\text{mV}$ for a duration of $<5\text{ms}$. After this, it rises to a level labeled $>-6\text{mV}$. IOUT starts at a high level, then drops to a level labeled "Reverse Current trip point -100mA " for a duration of $T_{\text{REV}} >5\text{ms}$. After this, it rises to a level labeled "Reverse Current trip point -100mA ". OCB is high throughout the sequence. The diagram also indicates the "RCP release trip point 25mV " and "MOS Turn off".

www.anpec.com.tw

Typical Application Circuit

Circuit 1.

Circuit 2.

Note: The C_{IN} is typically $1\mu F$. However, the parasitic inductance before VIN pin could cause voltage spike to damage internal circuitry. If voltage spike, especially during short circuit or hot plug-in of large capacitance load, on VIN exceeds VIN's absolute maximum rating, adding at least $10\mu F$ /MLCC capacitor at VIN is strongly recommended.

Function Description

VIN Under-Voltage Lockout (UVLO)

The APL3553E/F/G/H series of power switches have a built-in under-voltage lockout circuit to keep the output shutting off until internal circuitry is operating properly. The UVLO circuit has hysteresis and a de-glitch feature so that it will typically ignore undershoot transients on the input. When input voltage exceeds the UVLO threshold, the output voltage starts a soft-start to reduce the inrush current.

Power Switch

The power switch is an N-channel MOSFET with a low $R_{DS(ON)}$. The internal power MOSFET does not have the body diode. When IC is off, the MOSFET prevents a current flowing from the VOUT back to VIN and VIN to VOUT.

Current-Limit Protection

The APL3553E/F/G/H series of power switches provide the current-limit protection function. During current limit, the devices limit output current at current limit threshold. For reliable operation, the device should not be operated in current limit for extended period.

Short-Circuit Protection

When the output voltage drops below $V_{IN} - 1V$, which is caused by an over-load or a short-circuit, the devices limit the output current down to a safe level. The short-circuit current limit is used to reduce the power dissipation during short-circuit conditions. If the junction temperature reaches over-temperature threshold, the device will enter the thermal shutdown.

OCB Output

The APL3553E/F/G/H series of power switches provide an open-drain output to indicate that a fault has occurred. When any of current-limit or over-temperature protection occurs for a deglitch time of $t_{D(OCB)}$, the OCB goes low. If fault condition release, OCB will goes high when $VOUT > 1.5V$ (see Figure 1). Since the OCB pin is an open-drain output, connecting a resistor to a pull high voltage is necessary.

Enable/Disable

Pull the ENB above 1.4V or EN below 0.6V will disable the device, and pull ENB pin below 0.6V or EN above 1.4V will enable the device. When the IC is disabled, the supply current is reduced to less than $1\mu A$. The enable input is compatible with both TTL and CMOS logic levels. The EN/ENB pin cannot be left floating.

Over-Temperature Protection

When the junction temperature exceeds $140^{\circ}C$, the internal thermal sense circuit turns off the power FET and allows the device to cool down. When the device's junction temperature cools by $20^{\circ}C$, the internal thermal sense circuit will enable the device, resulting in a pulsed output during continuous thermal protection. Thermal protection is designed to protect the IC in the event of over temperature conditions. For normal operation, the junction temperature cannot exceed $T_J = +125^{\circ}C$.

Reverse-Voltage Protection

The reverse voltage protection feature turns off the N-channel MOSFET when a reverse current of $(VOUT - VIN)/R_{DS(on)}$ over $100mA$ (typ.) for $5ms$ (typ) deglitch time(see Figure 2). The APL3553E/F/G/H device allows the N-channel MOSFET immediately turn on once the output voltage goes lower than the input voltage by $25mV$ (typ)(see Figure 2). This prevents damage to devices on the input side of the APL3553E/F/G/H by preventing significant current from sinking into the input capacitance.

Application Information

Input Capacitor

10 μ F or higher ceramic bypass capacitor from VIN to GND, located near the APL3553E/F/G/H, is strongly recommended to suppress the ringing during short circuit fault event.

When the load current trips the SCP threshold in an over load condition such as a short circuit, hot plug-in or heavy load transient the IC immediately turns off the internal power switch that will cause VIN ringing due to the inductance between power source and VIN. Without the bypass capacitor, the output short may cause sufficient ringing on the input to damage internal control circuitry.

Input capacitor is especially important to prevent V_{IN} from ringing too high in some applications where the inductance between power source to VIN is large (ex, an extra bead is added between power source line to VIN for EMI reduction), additional input capacitance may be needed on the input to reduce voltage overshoot from exceeding the absolute maximum voltage of the device during over load conditions.

Output Capacitor

A low-ESR 150 μ F aluminum electrolytic between OUT and GND is strongly recommended to reduce the voltage droop during hot-attachment of downstream peripheral. Higher-value output capacitor is better when the output load is heavy. Additionally, bypassing the output with a 0.1 μ F ceramic capacitor improves the immunity of the device to short-circuit transients.

Layout Consideration

The PCB layout should be carefully performed to maximize thermal dissipation and to minimize voltage drop, droop and EMI. The following guidelines must be considered:

1. Please place the input capacitors near the IN pin as close as possible.
2. Output decoupling capacitors for load must be placed near the load as close as possible for decoupling high frequency ripples.
3. Locate APL3553E/F/G/H and output capacitors near the load to reduce parasitic resistance and inductance for excellent load transient performance.

4. The negative pins of the input and output capacitors and the GND pin must be connected to the ground plane of the load.

5. Keep IN and OUT traces as wide and short as possible.

6. The traces routing the R_{ILIM} resistor to the APL3553E/F/G/H should be as short as possible to reduce parasitic effects on the current limit accuracy.
